P R E F A C E

This Software Release Bulletin documents all fixes and enhancements that are incorporated in the new release identified on the cover page. The SRB is provided as a benefit of Hewlett-Packard's Account Management Support, Response Center Support, and Software Materials Subscription.

Of the five sections contained in the SRB (not including the PREFACE), only the last section which contains the detailed reports has page numbers. These are referenced by the product, report number and keyword indexes in order to direct the user to a particular area or to an individual detailed report. The five sections are described below.

SOFTWARE RELEASE CONTENTS

This section lists the product names, numbers and update/fix levels of all products contained in this release. Products that have changed, or are new are denoted with an asterisk preceding the product name.

PRODUCT INDEX

Each unique product name/number has an entry listing the page number where the detailed report for that product begins.

REPORT NUMBER INDEX

This index is a sequential list of the individual report numbers with the corresponding page number where the report can be found.

KEYWORD INDEX

This index is sorted by product name, keyword, product number (including the update/fix level) and by report number in that order. In addition to the sort items, each entry has a brief description (one line) and the page number where the detailed report can be found. Note that a given report can be listed more than once in this section if it has more than one keyword assigned to it.

DETAILED REPORTS

Each report contains all the available information relevant to the problem being corrected or the enhancement being implemented.

One-line description:

Monitor commands can fail depending on where it is linked

Problem:

Detailed Listing for Defect Number LSDqf04262

Text:

monitor commands can fail depending on where it is linked

If MONITOR_CONTROL ends up too close to the end of a 256 byte block when the code is linked, monitor commands such as read/write target memory will fail, possibly in ways that are not immediately obvious to the user. The problem is that the upper address register on the memory controller is not properly incremented so some of the command parameters are written to incorrect locations. For guaranteed correct operation, there must be at least 12 bytes available. For example, the last two hex digits of the location of MONITOR_CONTROL (from the global_symbols display) MUST be less than or equal to F4H.

This defect should exist as one DTS defect (pII_maint, eng i80x8x), but be expanded in STARS to the following emulators:

64220 8086/87, 80C86
64221 8088/87, 80C88
64225 80188

One-line description:

Monitor commands may not complete execution correctly with target sys.

Problem:

Monitor cmd's may not be given enough time to finish when the emulator is used with a target system. The monitor cmd's are any command executed by the monitor from the wait loop (ARE_YOU THERE, COPY, EXIT_MONITOR, etc.)

If the target system halts the emulator or runs extremely slow, the monitor command will not complete before the aries card cage gives up.

The card cage should wait 100 ms for the command to complete. Many of the emulators wait much less than this.

"bbaunload" does not work

Problem:

"bbaunload" does not work. The bba records can not be unloaded with the new version of the 8086 AxLS compiler.

The AxLS compiler was changed so that the symbol file contains 32 bit logical addresses instead of 20 bit physical addresses. The bbaunload software expects the physical address to be passed to readmemory() when the bba record is to be read.

Temporary solution:

The address must be converted from a logical to a physical address before the read is done.

The card cage should wait 100 ms for the command to complete. Many of the emulators wait much less than this.

One-line description:

"bbaunload" does not work

Problem:

"bbaunload" does not work. The bba records can not be unloaded with the new version of the 8086 AxLS compiler.

The AxLS compiler was changed so that the symbol file contains 32 bit logical addresses instead of 20 bit physical addresses. The bbaunload software expects the physical address to be passed to readmemory() when the bba record is to be read.

Temporary solution:

The address must be converted from a logical to a physical address before the read is done.

JC 7,LABEL generates a warning

Problem:

The manual for the MIL_STD 1750 (F9450) does not suggest a mnemonic for the JC 7 or Jump Conditional Unconditional. It seems logical enough! However the JC 7 command is the only way to perform a long jump.

The problem, we flag the JC 7 command with a "Warning-IO". This seems appropriate for the other conditions which provide mnemonics but not for a necessary command with no mnemonic. If a mnemonic for the JC 7 command exists (which I do not think it does) it should be implemented, if not, the warning message could be eliminated.

"1750AMS"
LABEL LIM R1,5
JC 7,LABEL
^ WARN IO
JC LT,LABEL

Temporary solution:

No known workaround at this time.

01.20

One-line description:

The Load address for sections is not kept current.

Problem:

When loading absolute records, the symconv utility does not keep track of the last address where a section loaded a byte. In the example given, the second record of bytes loaded into section 2 should start loading at ADDRESS 0x2010. Similarly, the second record of bytes loaded into section 3 should be loaded at address 0x3004.

The problem here is that load address for a section can only be assigned an address in three ways (in order of priority):

- 1) An ASP record explicitly assigns an address to a load section index
 - 2) If no ASP record is given, the address defaults to the base address given by an ASL record with a matching index.
 - 3) If no ASL record is given, the address defaults to zero (0).
- Once set, the load address for a section is changed in only two ways:
- Once set, the load address for a section is changed in only two ways:
- 1) Another ASP record is given for the section.
 - 2) Bytes are loaded in the section which increments the load address by the number of bytes loaded.

This type of behaviour is not currently documented in the specification but is the correct behaviour as understood by Microtec and HP.

One-line description:

Record attributes on VMS files are incorrect.

Problem:

The xlate utility on the VAX does create Motorola S Record files with the conventional "Record Attributes". Normally, the Record Attribute of an S Record file (ASCII file) is "Carriage return carriage control". The xlate utility creates a .H file with "none" as the Record attributes.

This can cause a few problems:

- viewing the file is difficult, because each record is not started on a new line when viewed via the "TYPE" command for example.
- some editors will not accept the file, because the one line is too long
- in this customer's case, the Microtec Research 6301 simulator cannot be used because the simulator will not accept the file.

The ASCII files created via xlate should have Record attributes of:
"Carriage return carriage control"

Temporary solution:

- create an fdl file such as "tovarcr.fdl" that looks like:

RECORD
 CARRIAGE_CONTROL carriage_return
 FORMAT variable

(note that tabs should be used, not spaces, and case should be as shown).

Then issue the command:

"convert/fdl=tovarcr <OLDFILE.H> <NEWFILE.H>"

The NEWFILE.H will have carriage return carriage control attributes.
